

These Equalities are Valid for Both Continuous and Discrete RV(s)

Theorem 3.5

For any random variable X ,

(a) $E[X - \mu_X] =$

(b) $E[aX + b] =$

(c) $\text{Var}[X] =$

(d) $\text{Var}[aX + b] =$

$$E[(X - \mu_X)^2]$$
$$g(X) = (X - \mu_X)^2$$

N students in a RLS section

In any minute, the probability that a student is on the phone is $p = 0.2$.

Let X be the no. of minutes before no student is on the phone.

$$P(X=x) = \begin{cases} (1 - (1-p)^N)^{x-1} (1-p)^N, & x \in \{1, 2, \dots\} \\ 0 & \text{otherwise} \end{cases}$$

Note that in any minute the success event is the event that no student is on the phone during the minute. Therefore any minute's outcome can be modeled using a Bernoulli RV, say Z , where $Z=1$ if no student is on the phone. Otherwise $Z=0$. The PMF of Z is:

$$P(Z=z) = \begin{cases} (1-p)^N & z=1 \\ 1 - (1-p)^N & z=0 \\ 0 & \text{otherwise} \end{cases}$$

The RV X is simply geometric($(1-p)^N$).

Families of Continuous RV(s)

Definition 3.5 Uniform Random Variable

X is a uniform (a, b) random variable if the PDF of X is

$$f_X(x) = \begin{cases} 1/(b-a) & a \leq x < b, \\ 0 & \text{otherwise,} \end{cases}$$

where the two parameters are $b > a$.

- CLAIM: The probability of an outcome being in any interval of a given size Δ is the same
 - How can we conclude this?

VVVS Problem

- What is $E[X]$?
 - $L/2$
- What is $E[X^2]$?
 - $L^2/3$
- What is $\text{Var}[X]$?
 - $L^2/3 - L^2/4 = L^2/12$

$$E[X^n] = \int_{-\infty}^{\infty} x^n f_X(x) dx$$

$$= \int_a^b x^n \frac{1}{b-a} dx$$

Theorem 3.7

Let X be a uniform (a, b) random variable, where a and b are both integers. Let $K = \lceil X \rceil$. Then K is a random variable.

- You want to describe the RV K

$$\begin{aligned} S_K &= \{a, a+1, \dots, b\} \\ \text{For } k \in S_K, P[K = k] &= P[X \in (k-1, k]] \\ &= \int_{k-1}^k \frac{1}{b-a} dx = \frac{1}{b-a} \end{aligned}$$

Theorem 3.7

Let X be a uniform (a, b) random variable, where a and b are both integers. Let $K = \lceil X \rceil$. Then K is a random variable.

- You want to describe the RV K
- K is a discrete RV. It is described completely by its PMF $P[K = k]$

Given the ceil function, all x that are $> k-1$ and $\leq k$ correspond to the outcome $\{K=k\}$

$$P[K = k] = P[k - 1 < x \leq k] = \frac{1}{b-a}$$

$$P[K = k] = P[k - 1 < x \leq k] = \frac{1}{b-a}$$

- The above is true for $k = a+1, a+2, \dots, b$
- $P[K=k] = 0$ otherwise.
- Clearly K is a discrete uniform RV

Exponential(λ)

Definition 3.6 *Exponential Random Variable*

X is an exponential (λ) random variable if the PDF of X is

$$f_X(x) = \begin{cases} \lambda e^{-\lambda x} & x \geq 0, \\ 0 & \text{otherwise,} \end{cases}$$

where the parameter $\lambda > 0$.

$$E[X] = \int_{-\infty}^{\infty} x f_X(x) dx$$

$$P[X > 0] = ? = \int_0^{\infty} \lambda e^{-\lambda x} dx$$

$$P\left[X \leq \frac{1}{\lambda}\right] = \int_0^{1/\lambda} \lambda e^{-\lambda x} dx$$

$$\int_0^{\infty} f_X(x) dx$$

$$= 1 - \frac{1}{e}$$

$$= 1$$

Definition 3.6 Exponential Random Variable

X is an exponential (λ) random variable if the PDF of X is

$$f_X(x) = \begin{cases} \lambda e^{-\lambda x} & x \geq 0, \\ 0 & \text{otherwise,} \end{cases}$$

where the parameter $\lambda > 0$.

- The inter-arrival time between two packet arrivals at a server may be modeled as an exp RV
- Received power may also be modeled as an exp RV

Definition 3.6 Exponential Random Variable

X is an exponential (λ) random variable if the PDF of X is

$$f_X(x) = \begin{cases} \lambda e^{-\lambda x} & x \geq 0, \\ 0 & \text{otherwise,} \end{cases}$$

where the parameter $\lambda > 0$.

- What is the average inter-arrival time?
